

**Dataset underpinning study: An investigation into helmet use, perceptions of sports-related concussion and seeking medical care for head injury amongst competitive cyclists**

The uploaded excel spreadsheet contains the dataset underpinning the above study which is to be submitted for publication.

The study deployed an anonymous self-report survey in which 405 competitive cyclists completed. Both qualitative and quantitative data was obtained in the survey design. The excel spreadsheet displays all questions asked and the responses of all participants.

The written manuscript details the process of survey construction, data collection and data analysis. Descriptive and inferential statistical tests were used to analyse the closed questions, and a conventional content analysis used to analyse open-ended questions.
